The following table shows the results of the regression analysis for the dependent variable "Number of children" (N = 1,000). The independent variables are "Age" and "Gender". The table includes the coefficient estimates, standard errors, t-statistics, and p-values for each variable.

Variable	Coefficient	Standard Error	t-statistic	p-value
Age	0.05	0.01	5.00	0.000
Gender	0.10	0.02	5.00	0.000

The results indicate that both Age and Gender are significant predictors of the number of children. The coefficient for Age is 0.05, indicating that for every unit increase in Age, the number of children increases by 0.05 units. The coefficient for Gender is 0.10, indicating that being female increases the number of children by 0.10 units compared to being male.

The following information is provided for the purpose of providing a general overview of the information contained in the report. It is not intended to be a substitute for the full report.

1990. The 1990s saw a significant increase in the number of people who were employed in the service sector, particularly in the retail and health care industries. This was due to a combination of factors, including the growth of the economy and the increasing demand for services.

One of the main reasons for this growth was the increasing demand for services. As the population aged, there was a greater need for health care and social services. Additionally, the economy was growing, and there was a need for more retail and service jobs.
